

Chemotherapy: two predictions that need no fitted potency

NO dose-response here is fitted: the repository's CTRPv2 route reached five ferroptosis compounds and no longer reaches anything, so every absolute kill fraction is a placeholder and only the SHAPES are results. (b)'s second pair of bars is the finding that was not designed in - out of cycle the phase-specific agent's disadvantage shrinks, because the flat agent is struggling too. (c) has two ends: no advantage with nothing to outrun, and none when regrowth is fast enough that both schedules return to the plateau. Whether any real tumour sits inside the shaded window is NOT established here.
