

What the microenvironment does to every arm, by cell state

glycolytic state

persister state

change in kill RELATIVE to the unstressed run (%) - negative is resistance

NOT a ranking. Signed deliberately: red is a loss, blue a GAIN, and the gains are real - clonal heterogeneity supplies a low-defence tail that dies while the average cell resists. A blank cell is EXACTLY zero for that arm - a cell the axis cannot move at all in this run, which is a property of the run rather than of the biology; an effect too small to round to a whole percent prints as <-1 or >-1 rather than vanishing. Every arm but radiation's DNA channel is parameterised with placeholders.
