

How far each modality reaches into tissue

(a) Kill at the surface and at depth

(b) Retention - and why it cannot be read alone

NOT a ranking. Both panels share one order, sorted by kill at depth, so the UNTREATED arm sits last in both - and in (b) it is the TALLEST bar, which is the point: retention is a ratio, and a ratio of two near-zero numbers is not robustness. Read (a) and (b) together or neither. Attenuation is fixed physics - PDT 0.31/mm, radiation 0.03/cm - while every kill magnitude rests on uncalibrated biochemistry.
