

What a published target could settle, per arm (4 fitted, 1 unconstrained, 1 inadmissible, 1 with no target)

CAR-T (adoptive transfer)	ADMISSIBLE
Oncolytic virus	ADMISSIBLE
Radiation (DNA channel)	ADMISSIBLE
Synthetic lethality (PARP)	ADMISSIBLE
Ablation (thermal)	UNCONSTRAINED
Checkpoint blockade	INADMISSIBLE
ADC bystander effect	NO TARGET

ADMISSIBLE means a parameter reproduces a published band, NOT that the arm is validated - every one of these still feeds no number the manuscript reports. The two rows that are not green are the informative ones: an inadmissible arm has a target that constrains a PRODUCT of factors neither of which is identifiable from it, and an arm with no target has nothing published to fit at all.
