

The ferroptosis-sensitive window: days for RSL3, weeks for SDT

(a) Treatment window: RSL3 closes, SDT stays open (b) Why: GPX4 re-expression closes the window

100,000 cells/condition; x-axis shows sampled timepoints (not linear in time). Defense-recovery half-times (GPX4 3 d, FSP1 7 d, NRF2 5 d, GSH 1 d) are literature-estimated, so window durations are approximate until experimentally validated.
