

What this engine can be asked, against what the field publishes

(a) The field's attention, by what the engine can express

(b) Every mechanism is present; 8 of 16 is applicable

Treatment arms: RSL3 (ferroptosis); SDT (physical-ROS); PDT (physical-ROS); Radiation (DNA damage, with a separate ferroptosis channel); Immunotherapy (immune cascade, no ferroptotic death required); AdoptiveCell (redirected effectors, bypassing DC priming); OncolyticVirus (lysis into the shared ICD chain); Ablation (threshold destruction, not a dose-response); Chemotherapy (log kill weighted by the cell cycle, not a redox state); AntibodyDrugConjugate (ferroptosis payload, delivery-limited). Volume is NOT comparable across mechanisms - descriptor breadth varies, so this is not a ranking; the ENGINE colour is the content. Generated from analysis/modality-coverage.json.
